The more you know, the more you can do with Photoshop. _Photoshop CS6_ A free upgrade from its previous version, Photoshop CS6 has many new features that add to the program's power, versatility, and efficiency.

With an added JavaScript code capability and new automatic web imaging technologies, Photoshop CS6 allows you to create and edit web pages and images for the World Wide Web, as well as mobile web pages for smartphones and tablets. Because Photoshop is so versatile, it's used for creating almost any kind of design for print or the web.

Photoshop CS6 is a fully functional image-editing

program that provides all the standard tools needed for photo manipulation. Even though it includes more capabilities than a smaller image editor, it's still not going to replace your printmaking or photography needs. If you're looking for a creative tool with a unique feature set, try CorelDRAW, which provides advanced drawing capabilities as well as the capability to produce

interactive Web pages and other multimedia formats. You can check out Chapter 2 for more information on the Photoshop CS6 upgrade path. [Adobe Photoshop Express](#) Adobe recently released a new mobile photo-sharing app that uses the Photoshop CS6 platform. This free app is used to share photos and easy-to-edit image effects with family and friends from your smartphone or tablet.

This app has some cool new features. For instance, your friends can download the app right from your Facebook or Twitter account, then share their photos right on those pages. Additionally, Photoshop Express is a robust editing program that uses all of the same tools as CS6. You can manipulate each photo as you would in the desktop version. The software comes as a mobile

application for iOS and Android devices and is available at this URL:

Illustrator Illustrator is a vector-based image-manipulation program that has been around for a long time. When you use Illustrator, you can manipulate images by using geometric shapes to create and shape them, as well as layers for increased control. Illustrator also has the capability to create

special effects, such as a watercolor or crackle effect. Instead of manipulating the pixels, Illustrator uses shapes that are a vector representation of the image. When your shape is moved or resized, the image doesn't appear to change. Illustrator also provides special effects, such

Step 1 - Begin with New Projects The first thing you need to do is create a new Photoshop Elements project for each image you want to edit. You can also use existing projects instead of creating a new one. If you want to use an existing project, go back to the main

Photoshop Elements workspace. It is the same on macOS and on Windows.

Go to File > Open and locate the Photoshop Elements folder on your computer. Click on the folder icon to open the folder and select the image you want to work with.

After creating a new project, you will have the main workspace for your work. It contains the layers, Smart Objects, Brushes and

other tools. Step 2 - Layers Panel

The Layers panel allows you to create new layers and adjust any of the layers currently open in Photoshop Elements. This panel is located in the top-left corner of the workspace. You can scale the panel down to its minimum size if you want to use the workspace in a small screen. If you click

Using a multi-variable mathematical model, researchers from the University of Georgia investigated the contributions of various climate factors to the mass extinctions documented in the fossil record. The study found that the average number of mass extinctions in the past 125 million years was roughly once

every million years, with a range of one to a few hundred per million years. The research team then looked at extinction events in five mass extinction eras to see what the dominant climate factors were in each of those eras, which determined the amount of warming that occurred in each era. "We found that when there are temperature spikes, there are more mass extinctions

and even some extinctions that are even larger than the most devastating mass extinction recorded in the fossil record," said Doug Archibald, UGA professor of Earth system science and College of Environment and Natural Resources. "This is the first study that has used this level of detail to look at multiple factors that influence extinction and what we're finding is that the extinctions that are

occurring today are a lot more than what was recorded in the past," he said. "And the amount of warming that occurred in the past has a lot to do with how far we are going to get in the future. So there's a real danger if we continue on the same path of greenhouse gas emissions, that we get more of those types of events and that we could disrupt ecosystems on a much larger scale in

the future." The team's model used data from 410 mass extinction events in the past 125 million years to look at the same geologic and climatic variables used in the current study. They found that the most important factor in determining the number of extinctions was the amount of warming that occurred and the intensity of that warming. When warming was relatively

moderate, extinctions were much less common, as seen in the past 130 million years. In contrast, extinctions spiked dramatically in mass extinction eras when the average temperature increased by more than 5 degrees Celsius, which is about a 7-degree Fahrenheit increase. When warming was particularly intense, extinctions were even more common. This

was the case during the Paleocene-Eocene Thermal Maximum (PETM), which occurred 54 million years ago. "It's pretty amazing to actually see that in a million years' time, we're going to have many more extinctions than we had in previous periods," said Archibald. "It tells us that we're at risk of being in a situation that is completely out of the ordinary from what we

Analysis of lipids from the tunicate, *Elliptio complanata*. The lipid composition of the tunicate *Elliptio complanata* has been examined by chloroform-methanol extraction. Ether/acid saponification and partitioning of the neutral lipids allowed a tentative classification of the molecular species into eight

fractions. Of these, seven account for more than 90% of the neutral lipids and contain triglyceride, diglyceride, and free fatty acid components. The free fatty acid content increases from embryonic to sub-adult stages of the tunicate and coincides with an increase in total lipids and arachidonic acid content. This suggests that free fatty acid synthesis by the embryo may be regulated

by the tissue arachidonic acid level. The mole ratio of triglycerides to phospholipids decreases during development. An analysis of some phospholipid classes also indicates that phosphatidylethanolamine is the most abundant species.
